Abstract (en)

[origin: WO2006037594A1] The invention relates to a louvered roller blind, comprising bodies (4), each with a bar (12), provided with at least one window (18) and a slat (9), with a first (10, 13) and a second hook (5, 6) in cross-section. The first hooks (10, 13) of the bar (12) and the slat (9) together form a hinge, permitting a relative pivoting movement of the bar (12) and slat (9), from a closed position in which the slat (9) covers the window (18) and an open position in which the slat (9) opens the window (18). The second hook (5) of the slat (9) forms a hinge with the second hook (6) of the bar (12) of an identical second body (4). The four hooks (5, 6, 10, 13) are each curved in the same direction.
