Abstract (en)

[origin: EP1800566A1] The system has a cylindrical body structure housing provided in a body structure (1) to ensure the positioning of an insert for fixing the insert with the body structure, and a locking clip (10) for blocking the insert in a preceding position. Two reliefs (11, 11') are adapted for clipping the locking clip on extensions projecting from the housing, where axial ends of the extensions are adjusted such that the ends slide between ribs (13, 13', 14, 14'). The clip is guided such that the clip extends a protrusion by surrounding the insert.
