Abstract (en)

[origin: EP1801670A1] The device has a lunar month wheel set (202) driven step by step to complete one revolution per ordinary and extraordinary cycles. The wheel set has a plate (207) that carries a toothed planetary wheel (208). The wheel includes stop elements (209) that are distributed over the circumference of the wheel to cooperate with a finger (210) of a stop part (203), where the position of the finger is determined by an annular shape rotating year cam (215). The cam has inner edges provided with a shoulder (216) whose level represents the presence and position of bissextile month in a current year.
