Abstract (en)

[origin: WO2006032301A1] Planning of a multi-stage production of finished products includes planning material flows of input products which go into the production of the finished products. For determining the flows of the input products it is advantageous to transfer information from orders for the finished products to orders for the input products. The transfer of information is done by determining relevant material flows between the finished products and the input products. One example for transferred information is the distinction between a sales order and a forecast order. In typical situations, coverage of sales orders has a higher priority than coverage of forecast orders and such information allows prioritization of orders for the input products.
