Abstract (en)

[origin: WO2006042932A1] The invention relates to the access control for a television receiver terminal (4), communicating with a remote server (2), by means of a two-way connection (81-82) and receiving, amongst others, an encoded multimedia stream. According to the invention, the access information for the terminal is stored in the server and the terminal. Hence, on powering up the terminal, said terminal automatically establishes a connection to the server, which recovers at least a part of the access information stored in the terminal and verifies agreement with the information stored in the server. As a function of said verification, the server either authorizes or not, a downloading to the terminal of software applications for decoding the multimedia stream.
