Abstract (en)
[origin: EP1803362A1] The shoe has a rigid sole (1) fixed on a sliding device, a rigid upper (2) provided with an upper opening (15) for receiving foot of a skier, and a deformable connecting element (3) provided between the sole and the upper. The connecting element presents less thickness and allows lateral oscillation of the upper relative to the sole. The connecting element is housed on an upper surface of the sole and comprises an end (11) laterally extending from an end (6) of the sole to receive front part of a shell (12) of the upper. An independent claim is also included for a method for fabricating a sport shoe for a sliding device.
