Abstract (en)

[origin: EP1653050A1] The method involves including a partial final load application cycle. Temporary load values for the phases of the partially completed load application cycle are included with a given fixed value, where a zero value is given as a fixed value. The difference of maximum and minimum of the cycle (8, 12, 6, 10) is formed as an intermediate value for the determination of an approximation value.
