Abstract (en)  
[origin: EP1806295A2] The closure (1) has a supporting device with a supporting unit (6) that is transferred from a position in an undeformed condition into another position in a deformed condition of the supporting unit. The supporting unit has a contact area, which transfers supporting force on a filling material in the latter position. The contact area of the supporting unit is arranged adjacent to a central axis of the box in the latter position than in the former position. The components of the closure are manufactured from thermoplastics e.g. polyethylene and polypropylene, in an injection molding procedure. An independent claim is also included for a method for producing a closure for the box.
