Abstract (en)
[origin: EP1806307A2] The method involves connecting an end of guide carrier (14) with a support part (5) of roller at a side of the machine frame. The guide carrier is extended across the width of the belt (1) axial to the roller. The guide carrier has an outer runner slide rail (12) which runs axial to roller into the machine across an inner runner slide rail (13). A carriage (9) is placed on the outer runner slide rail for retaining and guiding of belt which drives the belt into the machine after removing the intermediate pieces (7).
