Abstract (en)
[origin: WO2006010086A2] A packaging apparatus forms a completely sealed composite package. The apparatus employs a continuous process which involves conditioning a surface of the package substrate. The substrate includes an adhesive coating that can be reactivated by infra-red radiation and adheres the package substrate to a juxtaposed face of a second surface. The apparatus uses rollers (102, 104,; 118, 120) to compress the two surfaces together to complete the construction process.
