Abstract (en)

[origin: WO2006048381A1] The invention relates to a separation path (2) of an electric switching device, which is defined by two contact pieces (3, 4) which can be displaced in relation to each other. The relative position of the contact pieces (3, 4) is detected by a first position monitoring device (7) and by a second position monitoring device (8). Also, the insulation resistance of an insulating medium located in the region of the separation path (2) is determined. According to the invention, a release signal (12) is produced in the presence of a specific relative position of the contact pieces (3, 4) and an insulation resistance of the insulating medium which is associated with the relative position, said signal classifying the separation path (2) as in the separation position.
