Abstract (en)
[origin: US2007175147A1] A floor strip for bridging a joint between two floor coverings that border on one another comprises a base profile that can be fixed in place on the floor, two upwardly extending shanks molded on the base profile, and a cover profile having at least one cover wing that projects laterally. There is a downwardly directed crosspiece, which is connected with the base profile by way of an articulation. The articulation is formed by an articulation rail that is rounded on both sides and grasped between the shanks of the base profile. The shanks are upright but rounded on the inside. The articulation rail is formed by a solid material or by a sleeve, which has a longitudinal groove, into which the crosspiece and/or an attachment means that engages through the cover profile passes. In certain sections, the longitudinal groove passes completely through the articulation rail, and the crosspiece of the cover profile has a greater depth in these regions.
