Abstract (en)
[origin: EP1808557A1] The fitting has a locking unit to lock a locking part in unlocking position when a window or door's opening frame is opened. The unit has an actuating finger cooperating with a releasing abutment associated to a window frame for controlling releasing of the locking unit when the opening frame is closed on the window frame. A discrete type adjusting unit (9) adjusts a relative position of the abutment with respect to the finger, and has an indexing unit (10) for allowing the finger and the abutment to occupy two distinct positions on the opening frame or the window frame.
