Abstract (en)
[origin: WO2006050821A1] The invention relates to a sighting device (2) for the range-based setting of a line of sight (7), said device (2) being fastened to a weapon (1) by means of a base body (4) that is permanently fixed to the weapon. A holder (5), which houses a sight (6) that defines the line of sight (7) and which can be pivoted vertically, is coupled to the base body (4). The holder (5) and the base body (4) can be fixed in different pivotal positions in relation to one another by means of a detent device (9). An adjustable detent element (11) on the detent device (9) engages in a setting region (15, 15') and can be released from said position. Several ammunition-specific setting regions (15, 15') are provided, each equipped with one or more detent points (14, 14') that are specific to the target range. The holder (5) can be locked in a respective pivotal position in relation to the base body (4) at said points by means of the detent element (11), thus defining an ammunition-specific and range-specific line of sight (7) of the sight (6). The invention also relates to a weapon (1) that is equipped with a sighting device (2) of this type.
