Abstract (en)
[origin: EP1810728A1] The boot fixing system comprises front (2) and rear (3) spring-loaded clamps that release automatically when subjected to forces above a set level, and a supplementary electronically-controlled release mechanism (4) equipped with a mechanically-controlled lock. The mechanical control consists of a component such as a lengthwise bar (10) that prevents the front or rear clamp being moved by the electronic control. The bar is locked by a switch (29) on the electronic control box connected to a slider inside it.
