Abstract (en)

A hair clipper 10 is adapted to vibrate a comb-shaped movable blade 30 with a vibratory linear actuator 12 in a state that the comb-shaped movable blade 30 is pressed against a comb-shaped fixed blade 29 by means of spring members 31. The spring members 31 also serve as a resonance spring for resonating the movable blade 30 in the reciprocating movement directions "F" and it is possible to independently adjust a spring force component "H" acting to press the movable blade 30 against the fixed blade 29 and a spring force component "I" acting to resonate the movable blade 30 in the reciprocating movement directions "F". Thus, by increasing the spring force component "H" acting to press the movable blade 30 against the fixed blade 29, it is possible to improve a cutting performance of the hair clipper 10 while reducing the size thereof.
