Abstract (en)

A component suitable for forming a corner with a rounded edge in a leaf of a frame is described, the corner being formed by a first section and a second section, the component comprising: a round shell-like head with a curved external surface and an internal surface, which is also preferably curved; a first side surface and a second side surface which are substantially perpendicular to each other; and a shank which extends from said second side surface, said shank being able to engage in a corresponding seat of the first section which forms the corner.
