Abstract (en)

[origin: EP1811644A1] In the present invention, a rectified voltage is controlled in accordance with variations in power supply voltage without having to separately provide a mechanism for detecting a peak value of the power supply voltage. A q-axis voltage command value ( $V_q^*$ ) is generated in a proportioned amount to an end-to-end voltage ( $V_{dc}$ ) of a smoothing capacitor (4). A d-axis current command value ( $I_d^*$ ) is set to zero, and a d-axis voltage command value ( $V_d^*$ ) is generated based thereon. A pulse width modulator (605) performs pulse width modulation based on the q-axis voltage command value ( $V_q^*$ ) and the d-axis voltage command value ( $V_d^*$ ), and generates a signal that controls switching of a pulse width modulation converter (3).
