Abstract (en)
[origin: WO2006046877A1] A batten (15, 16) to interpose between cladding (17) and timber substrate (eg. Framing or other) elements (12), of an elongate strip like form of thickness of a desired set out distance. The batten (15, 16) has across its width means whereby water and air can move through the strip like form. Preferably the batten (15, 16) is cut as a transverse strip of a precursor material that has been extruded to define a sheet like material of the thickness of a batten with extrusion axis extending passageways.
