Abstract (en)  
A router (20) is provided with a digital display device (5). The route has a depth rod (4) that includes a first sensor element (10) movable with respect to a second sensor element (11) that is mounted on a motor housing (2). The sensor elements transmit a position signal to the digital display device for reading of the displacement of the depth rod relative to the motor housing. This helps to reduce human error of incorrect reading.
