Abstract (en)

[origin: EP1813820A1] The fan has a rotary propeller (18) rotative around an axis (X-X'), and comprising a central unit (20) and two fan blades (22). Each auxiliary air deflector (26A, 26B) is integrated to the propeller such that the auxiliary air deflector is driven in rotation with the propeller, and is arranged in a swept volume by the blades during rotation of the propeller. The propeller has a peripheral ferrule (24) connecting free ends of the blades. The auxiliary air deflector (26B) radially projects towards the central unit from the ferrule.
