Abstract (en)

[origin: EP1814012A2] The method involves transmitting an electrical signal of a driver and of a co-driver by signal generators (3,4,17). Each generator controls the control member (16) for controlling the generator. The driver and co-driver signals are fed into the over-controlling device (5). In case the device receives the signal of the co-driver, an over-controlling of the co-driver signal over driver takes place. In case of over-controlling co-driver signal, the control of the control member (16) takes place. An independent claim is also included for a device for over-controlling of a vehicle in the driving school.
