Abstract (en)

[origin: WO2006047968A2] The automatic grill for cooking meats and fish consists of the grills of an acute angle (1), the mechanism of circular retrogressive movement (2) and the motor of double use (3). The grills of acute angle (1) fit on mechanism (2) and are given a semicircular retrogressive movement at fixed times. Mechanism (2) is given a circular movement by the motor of double use (3) and transforms it into a semicircular retrogressive movement which is transmitted to the grills of an acute angle (1). The double use motor (3) from the lower square female reception (5) transmits movement to the mechanism (2) which moves the grills (1) and from the upper square female reception (4) transmits movement to the mechanism revolving the spits or the bodkins. The particular characteristics and advantages of this invention are that the grill revolves automatically, that the edible stuff is cooked on the grill (1) and that there is no need for the human factor to turn by hand and with the motor of double use (3) the spit and the bodkins are automatically cooked. Thus there is a motor for two uses.
