Abstract (en)

[origin: US2006100022A1] A wireless scoring system is provided which does not require any interconnecting wires between the scoring equipment and the fencers and which requires no change in existing fencing or scoring equipment. A touch detector unit is worn by each fencer and is operative to provide signal indications of fencing touches or hits which uniquely identify each fencer and which signify valid and invalid hits and which can be wirelessly transmitted to receiving apparatus coupled to the scoreboard or other scoring equipment. The system is plug compatible with existing fencing weapons and scoring equipment and is readily employed therewith.
