Abstract (en)

[origin: WO2006051186A2] The invention relates to a method for realizing a particle network comprising a particle depositing step, capable of self-organizing with a determined increment along a first direction, onto a substrate exhibiting a property that permits an interaction between the substrate and the particles and modulated along the first direction with a period adapted to said increment. A substantial interaction thus subsists between each of the particles and its neighboring particles along the first direction.
