Abstract (en)

[origin: WO2006053835A1] The invention relates to a method of assessing compatibility between at least one application (A1, A2, A3, A4) and at least one processing device (D1, D2) that hosts and/or executes and/or interacts with at least said application. The inventive method is characterised in that it comprises a comparison between: (i) at least one profile (DCT1) from among the profiles associated with the devices describing respectively the functions supported by each device and (ii) at least one profile (ACT1) from among the profiles associated with the applications describing respectively the functions used by each application, in order automatically to establish an analysis of the functional compatibility between one or more applications and one or more devices.
