Abstract (en)

[origin: EP1815768A1] The device has a sliding part (9) including a cam (11) and adjustable transverse to an extracting unit (1). The sliding part is fastened at a corpus and is extractable into a closing position using tension springs (15, 16). The cam acts together with bends that are fastened to the extracting unit. The bends have a recess in the closing position of the extracting unit and are made of plastic. The cam is pressed in the recess using the tension springs in the closing position. The cam runs along tracks of the bends during pushing of the extraction unit into the corpus.
