Abstract (en)

[origin: EP1816264A1] The side barrier for a traffic lane (10), and especially at a bridge (1), defines a path (9) for pedestrians and cyclists between the traffic lane and the bridge railing (4). The barrier plates (7,8) are butted together to form a wall, mounted on base guides (23) aligned across the traffic lane. At least one barrier plate is fitted with a sensor (25) to register a movement shift, with a signal transmitter with a link (27) to an evaluation unit. The power supplies are provided by a solar cell (31).
