Abstract (en)
[origin: EP1816290A2] The device (1) has a control unit (8), which operates the closing device (2) during detecting of a pull at a handle (3) in closed door or flap in such a manner that the door or flap is opened. The handle acts on a transmitting mechanism (5), which opposes force to movement caused by pulling on the handle. The transmitting mechanism is formed in such a manner that when the handle is pulled with a force, which is larger or equal than an emergency opening force, the transmission mechanism is moved such that, it operates the closing device, so that the door or flap is opened. The transmitting mechanism is formed in such a manner that when the handle is pulled with a force, which is smaller than the emergency opening force, but sufficient for producing pulling indicating output signal of the sensor (6), the transmitting mechanism is moved in such a manner that a handle movement is performed, which is perceptible to the operator of the handle.
