Abstract (en)
In a system wherein data is provided to a plurality of endpoints connected by a point-to-point communication channel, an automatic method for optimizing data transmission comprising; querying at least a subset of the endpoints in order to determine whether they can receive transmissions broadcast to a first multicast address; receiving, from at least one of said endpoints, an acknowledgment message; and for at least one received acknowledgment message indicating that an endpoint can receive transmissions broadcast to said first multicast address, deactivating said point-to-point communication channel with the endpoint from which said message is received.
