Abstract (en)
[origin: WO2006040353A1] The invention relates to a method for burning in the multi-dissemination of distributed objects, characterized in that a file (1)is created, describing the interface between distributed applications independent of the language used for the management of objects; a file is created (2), describing the qualities of expected services; a list of metamodels (4, 5) which are independent of the language of the application is generated; a burn-in algorithm library (6) is created; a receptacle is created, wherein the user describes the behaviour of the application (8); a parameterization service file is created for the client (7) and a parameterization service file is created for the server (8) and an executable program is created by means of compilation (9) in order to manage clients and servers (10, 11).
