Abstract (en)

[origin: WO2006048130A1] The invention relates to a monitoring device for shipping goods, comprising a support via which the monitoring device can be fixed to an application, signal-emitting and/or signal-receiving components that are arranged on the support, and connecting lines between components, said connecting lines being disposed on the support. In order to create a monitoring device that can be used in a simple and secure fashion, the support is configured such that one or several connecting lines are damaged when the support is detached from an application to which the same is fixed.
