Abstract (en)

[origin: EP1817984A1] The device has a locking unit and an actuator (11) including stop surfaces, which absorb impact during a coupling process for a coupled movement of furniture parts during a movement operation. The movement operation represents a controlled operation mode for the movement of the furniture parts relative to one another. One of the stop surfaces is formed at a spring tongue (13), and a recess is provided in a spring direction behind the stop surfaces for providing spring deflection of the stop surfaces.
