Abstract (en)

[origin: EP1818143A1] Cutting device (1) comprises roller blades (17) which move in relation to the lower side of the cutting device and do not protrude over the lower side of the device in their starting positions but protrude over the lower side of the device in the cutting position. Each roller blade is fixed to the device so that the cutting process is only started by moving the whole device over the sheet material. Preferred Features: Each roller blade is coupled with an actuating element via which the roller blade is moved between a starting position and the cutting position. The actuating element has a rotating body (6) which rotates in relation to the device body (2) and is displaced in a rotating movement to move the roller blade between a starting position and a cutting position.
