Abstract (en)

[origin: WO2006056109A1] The present invention discloses an iron convenient for winding up a power cord and a method for takeup of the power cord. The iron includes a main body of iron, a sole which is provided on bottom of the main body, a electrical heater which is disposed in the main body for heating the sole and connected to a power cord extending to the outside of the main body, a handgrip portion which is formed above the main body, wherein a winding space around which the power cord is wound is formed between the handgrip portion and the main body. The present invention is different from the conventional iron. In the iron according to the present invention, a winding portion of a power cord is formed between a handle and a main body of iron so that the handle and the takeup device for the power cord are integrated together. Furthermore, a space between the handle and the main body is sufficiently utilized, and also the takeup device for the power is simply constructed and does not tend to break down.
