Abstract (en)

A fixing device for at least a plate or panel (2) comprises matching means (4) for a first face (3) of a perimetrical portion of the plate or panel (2). The device (1) comprises at least a fixing means (5) having a first longitudinal edge (6) with connecting means (7, 8) for the matching means (4) and a second longitudinal edge (9) having a joint (10) for sealing means (11) fit to match a second face (12) of said perimetrical portion of the plate or panel (2). Such fixing means (5) is moreover provided with longitudinal housing means (13), interposed between the longitudinal first (6) and second (9) edges, and fit for housing an expansion means (14). In a fixing condition, the expansion means (14) into the housing means (13) causes at least a light deformation of the fixing means (5) in consequence of that the joint (10) and the respective sealing means (11) translate at least slightly towards the second face (12) of the perimetrical portion of plate or panel (2) so becoming locked and fixed between matching means (4) and sealing means (11).
