Abstract (en)  
[origin: US2006117453A1] The apparatus comprises a garment for use as a backpack. The garment comprises an anterior member and a posterior member. The anterior member can be divided into a right half and a left half, each half having a top edge, a medial edge, and a distal edge. The posterior member can have an interior side, an exterior side, a surface area, a right edge, a left edge, and a top edge. The anterior member and the posterior member can be joined such that the top edge of the right half of the anterior member is joined to the top edge of the posterior portion from a point substantially at the right edge of the posterior member and continuing medially, and the top edge of the left half of the anterior member is joined to the top edge of the posterior portion from a point substantially at the left edge of the posterior member. The anterior member can have at least one pocket fixedly attached thereto. The posterior member can have at least one large pocket fixedly attached thereto, the large pocket covering less than or equal to fifty percent of the surface area of the posterior member, the large pocket preferably being located substantially proximal to the top edge to allow a user to access the pocket over her shoulder. In a preferred embodiment, total pocket volume available on the anterior member would be sufficient to counterbalance total pocket volume available on the posterior member.
