Abstract (en)
[origin: WO2006057536A1] A vessel cap having a straw comprises a body mounted at a vessel inlet through which liquid material stored in a vessel is discharged outward, having a straw receiving portion at an upper surface thereof, and having a through hole at one side of the straw receiving portion; a straw horizontally disposed in the straw receiving portion of the body, and passing through the through hole thereby penetrating a sealing member formed at a vessel inlet when vertically positioned; and a connection film connected between an inner circumferential surface of the through hole of the body and an outer circumferential surface of the straw for guiding the straw to be vertically positioned. Once the straw is uprighted, the straw penetrates the sealing member. A user can drink the liquid material stored in the vessel by only one operation to open the cover thereby to enhance the user's convenience.
