Abstract (en)
[origin: WO2006061312A1] Disclosed is an exterior door handle (1) for a motor vehicle, comprising an electromechanical locking system (2) and a manually actuated handle part (3) that can perform a lifting movement in order to open a door (11) lock (8). The lifting movement of the handle part (3) is subdivided, a device (9) generating an increased actuation resistance and a switch (20) electrically opening the door lock (8) at the end of a first lifting distance (21). The handle part (3) can travel an additional lifting distance (23) beyond the first lifting distance (21) in case the electric power supply is interrupted or the electric locking system (2) breaks down, said additional lifting distance (23) mechanically opening the door lock (8).
