Abstract (en)

[origin: WO2006048073A1] The invention relates to a coupling device for the connection of lines with a retainer device (1), comprising an outer piece (2) and an inner piece (3), arranged in the outer piece (2). Said coupling device is characterised in that the outer piece (2) and the inner piece may be displaced relative to each other in the longitudinal direction of the retainer device (1), between a locked position and a released position, whereby at least one taper surface (2a) is provided at an angle to the longitudinal axis of the retainer device (1) on the outer piece (2), cooperating with at least one complementary taper surface (3a), provided on the inner piece (3).
