Abstract (en)

[origin: EP1821262A2] The system has a central server (1) connected with terminals at control points by data transmission connections, where relevant data of the terminals and person are stored in the server. A determination is executed in one terminal based on information stored in the terminal to find whether an action that is to be authorized is enabled at the terminal in the starting event of the person, without a straight data transmission link to the central server.
