Abstract (en)
In a via-human-body information transmission system, there is made so as to be capable of more stably transmitting a signal. An electrode (104) of a transmitter-receiver (102) contacting with or capacitance-connected to a human body (101) and an electrode (108) of a receiver (106) contacting with or capacitance-connected to the human body (101) are electrically connected through the human body (101) (mainly, a chest part and a left arm). An electrode (105) of the transmitter-receiver (102) contacting with or capacitance-connected to the human body (101) and an electrode (109), of the receiver (106), having been disposed while being directed to an outside of the human body (101) are electrically connected by a capacitance connection. A communication between the transmitter-receiver (102) and the receiver (106) is performed through a path passing the electrodes (104, 105, 108, 109) and the human body (101) and a path by the capacitance connection.
