Abstract (en)
[origin: WO2006063570A1] The invention relates to a combat vehicle with an anti-aircraft system. A device carrier configured as an azimuth-pivotable turret (4) is arranged on the top side of the combat vehicle (1), and carries as the first effective element for the purpose of air defense an automatic weapon (4) which can be pivoted into an elevation position. The second effective element for the purpose of air defense is at least one launching device (8', 8) for vertically taking off guided missiles mounted at the rear of the combat vehicle (1). The launching device (8', 8) can be displaced from a horizontal transport position into a vertically oriented launching position. The launching device (8') can be integrated into the vehicle contour in the transport position and can be arranged at a defined distance to the combat vehicle in the launching position.
