Abstract (en)
[origin: WO2006063893A1] The invention relates to a method for the production of a semiconducting or photovoltaically active film by coating a substrate film with a suspension containing a carrier fluid and nanoscopically small particles of a photovoltaically active or semiconducting material dispersed in said carrier fluid; by heating the surface of the coated substrate film to a temperature during a period of time which is sufficient for said nanoscopically small particles to at least partially melt; by cooling the coating below the crystallization temperature of the photovoltaically active or semiconducting material; and by separating the substrate film. The invention also relates to films that can be obtained according to said method, and to electronic components and solar cells containing said films.
