Abstract (en)
A fitting assembly for releasable locking a sash component (10) with respect to a main frame component (4) of an openable window structure comprises first and second fitting members fastened to the main frame component and the sash component, respectively, and pivotally connected with each other, and a stay member pivotally connected with each fitting member at a distance from its pivotal connection with the other fitting member. The pivotal connections between the first and second fitting members and between the first fitting member and the stay member are formed by releasable engagement of first and second engagement means provided by a slide member fitted in the first fitting member and at a first end of the second fitting member, respectively, and releasable engagement of third and fourth engagement means provided at a second end of the first fitting member and a first end of the stay member, respectively. For compensation of distortion or misalignment of the sash component with respect to the main frame component the position of the pivotal connection between the second end of the first fitting member and the first end of the stay member may be adjusted by adjusting means provided by the third engagement means.
