Abstract (en)

A mobile communication terminal communicates with a base station of an infrastructure network via any one of a single-hop route, and a multi-hop route using other terminals. The mobile communication includes an application processor and an access route selector. The application processor is configured to process an application involving communications with the base station. The access route selector is configured to select an access route out of the single-hop route and the multi-hop route, in accordance with information on the application.
