Abstract (en)

[origin: FR2879866A1] The method involves storing a number in a memory of an electronic component and generating a secret number. The secret number is generated by randomly selecting two integers whose sum is equal to another number, deciding whether the latter number is the stored number and storing the integers in the memory if the latter number is the stored number, otherwise, repeating selecting and deciding steps. An independent claim is also included for an electronic component.
