Abstract (en)

[origin: WO2006067281A1] A communication system providing at least two access types for communication, wherein a first user equipment comprises means for communicating with a network node of the communication. A second user equipment has a first identity for identifying the user in a first access type, and a second identity for identifying the second user in a second access type. The first user equipment comprises means for forwarding the first identity of the second user equipment to a network node, said network node comprises means for, in response to receiving the first identity of the second user equipment, retrieving the second identity of the second user equipment; and said network node comprises means for initiating a functionality of a service accessible by the second user identity. This provides a simple and efficient way to combine two communication types for enhancing the services of either type.
