Abstract (en)
Provided are a printing method and device carrying out printing on a portion to be printed of a moving object by a printing head, preferably a thermal head arranged not to move in a moving direction of the printing object. In the printing device carrying out printing on the place to be printed of a packaging film (10) as the moving object supplied between a printing head (8), arranged not to move in the moving direction of the moving object, and a support surface (9), the printing device comprises moving rolls (15, 16) arranged on both sides of the support surface (9) to change a stagnation quantity of the packaging film (10) on a side of the support surface (9). The printing is carried out by the moving rolls (15, 16) being displaced to temporarily change a moving velocity of the portion to be printed. The portion to be printed of the packaging film (10) is moved at a predetermined velocity held within a velocity range within which a clear printing can be carried out by the thermal head. Thereby, even on the portion to be printed of the packaging film (10) generally moving at a velocity higher than, or lower than, the predetermined velocity, a clear printing can be carried out.
