Abstract (en)

[origin: FR2878536A1] The procedure consists of placing the textile material to be finished inside a chamber with treatment agents, applying microwave radiation at atmospheric pressure, putting the material inside the chamber in contact with a surface that can be heated, and extracting water vapour from the chamber during the whole treatment process. The procedure consists of placing the textile material to be finished inside a chamber with treatment agents, applying microwave radiation at atmospheric pressure, putting the material inside the chamber in contact with a surface that can be heated, and extracting water vapour from the chamber during the whole treatment process. The treatment agents are applied by impregnating the textile material in a bath of necessary reagents and then wringing it out to leave a content of 40-200%. The microwave radiation is applied at a power of 0.8-3 kWh per kg of material, which spends 60-240 seconds inside the chamber, while the contact surface is heated to 40-210 [deg]C. An independent claim is also included for a treatment apparatus.
